Real Intelligence

Driving 2Cr+ Daily Incremental Sales

For Jyothi Labs, a Bizom partner since 2015, the sales had already been digitised. Leadership had access to performance visibility across markets. But one question remained: **Can we drive more from the same network?**

The very question became the foundation of establishing the execution bedrock.

To start with, all outlet visits were digitised, beat planning and call flows were standardised, and SKU-level order capture with schemes and returns were cleaned.

Real Intelligence as an Execution Engine

Bizom's Real Intelligence Engine continuously analyses field behaviour to identify incremental value opportunities at the outlet level.

Outlet-specific buying behaviour and nearby outlets' patterns

Sales history weighted toward recent visits

SKU hierarchies and parent-child relationships

Visit frequency, returns, and average lines per call

RI Copilot in the Sales Call

RI Copilot embedded Real Intelligence directly into the sales workflow. Each visit began with structured context:

SKUs relevant to the specific outlet

Quantity guidance grounded in behaviour and peer patterns

Signals for upsell, cross-sell, and recovery

The impact

As intelligence became part of daily execution, sales behaviour shifted across the field force.

Sales representatives moved from order taking to guided selling. Decisions aligned more closely with outlet capacity rather than habit.

Execution consistency improved across territories, even as outlet diversity increased. This shift marked the transition from transactional selling to intelligent execution.
